There is a critical bug on cmake 2.8.6 or below. See:

<http://stackoverflow.com/questions/9948375/cmake-find-package-succeeds-but-returns-wrong-path>.

The bug about FindPackage() is fixed with cmake 2.8.7 and above.

There is also another big change that is good to know:

cmake 2.8.7 and above prefer library packages installed system-wide over local ones. Before it was the opposite.
